

SMJ4164

65,536-BIT DYNAMIC RANDOM-ACCESS MEMORY

JULY 1985 — REVISED MAY 1988

- 65,536 × 1 Organization
- Single 5-V Supply ($\pm 10\%$ Tolerance)
- Upward Pin Compatible with '4116 (16K Dynamic RAM)
- Available Temperature Ranges with MIL-STD-883C High-Reliability Class B Processing:
 - S . . . -55°C to 110°C
 - L . . . 0°C to 70°C
- Long Refresh Period . . . 4 ms
- Low Refresh Overhead Time . . . As Low As 1.8% of Total Refresh Period
- All Inputs, Outputs, Clocks Fully TTL Compatible
- 3-State Unlatched Output
- Common I/O Capability with Early Write Feature
- Page-Mode Operation for Faster Access
- Low Power Dissipation
 - Operating . . . 125 mW (Typ)
 - Standby . . . 17.5 mW (Typ)

● Performance Ranges:

	ACCESS TIME	ACCESS TIME	READ OR WRITE CYCLE	READ-MODIFY-WRITE CYCLE
	ROW ADDRESS (MAX)	COLUMN ADDRESS (MAX)	(MIN)	(MIN)
'4164-12	120 ns	70 ns	230 ns	260 ns
'4164-15	150 ns	85 ns	260 ns	285 ns
'4164-20	200 ns	135 ns	326 ns	345 ns

- SMOS (Scaled-MOS) N-Channel Technology

PIN NOMENCLATURE

A0-A7	Address Inputs
$\overline{\text{CAS}}$	Column-Address Strobe
D	Data In
NC	No Connection
Q	Data Out
$\overline{\text{RAS}}$	Row-Address Strobe
V _{DD}	5-V Supply
V _{SS}	Ground
$\overline{\text{W}}$	Write Enable

description

The SMJ4164 is a Military high-speed, 65,536-bit, dynamic random-access memory, organized as 65,536 words of one bit each. It employs state-of-the-art SMOS (scaled MOS) N-channel double-level polysilicon gate technology for very high performance combined with low cost and improved reliability.

The SMJ4164 features $\overline{\text{RAS}}$ access times of 120 ns, 150 ns, and 200 ns maximum. Power dissipation is 125 mW typical operating and 17.5 mW typical standby.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

SMJ4164

65,536-BIT DYNAMIC RANDOM-ACCESS MEMORY

Refresh period is extended to 4 milliseconds, and during this period each of the 256 rows must be strobed with $\overline{\text{RAS}}$ in order to retain data. $\overline{\text{CAS}}$ can remain high during the refresh sequence to conserve power.

All inputs and outputs, including clocks, are compatible with Series 54/74 TTL. All address lines and data in are latched on-chip to simplify system design. Data out is unlatched to allow greater system flexibility. Pin 1 has no internal connection to allow compatibility with other 64K RAMs that use this pin for an additional function.

The SMJ4164 is offered in a 16-pin dual-in-line ceramic sidebrazed package (JD suffix) and in a leadless ceramic chip carrier package (FG suffix). The JD package is designed for insertion in mounting-hole rows on 7,62-mm (300-mil) centers, whereas the FG package is intended for surface mounting on solder lands on 1,27-mm (0.050-inch) centers. The FG package is a three-layer, 18-pad, rectangular ceramic chip carrier with dimensions of 7,37 × 10,8 × 1,65 mm (0.290 × 0.425 × 0.065 inches).

operation

address (A0 through A7)

Sixteen address bits are required to decode 1 of 65,536 storage cell locations. Eight row-address bits are set up on pins A0 through A7 and latched onto the chip by the row-address strobe ($\overline{\text{RAS}}$). Then the eight column-address bits are set up on pins A0 through A7 and latched onto the chip by the column-address strobe ($\overline{\text{CAS}}$). All addresses must be stable on or before the falling edges of $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$. $\overline{\text{RAS}}$ is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. $\overline{\text{CAS}}$ is used as a chip select activating the column decoder and the input and output buffers.

write enable ($\overline{\text{W}}$)

The read or write mode is selected through the write-enable ($\overline{\text{W}}$) input. A logic high on the $\overline{\text{W}}$ input selects the read mode and a logic low selects the write mode. The write-enable terminal can be driven from standard TTL circuits without a pull-up resistor. The data input is disabled when the read mode is selected. When $\overline{\text{W}}$ goes low prior to $\overline{\text{CAS}}$, data-out will remain in the high-impedance state for the entire cycle, permitting common I/O operation.

data in (D)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the falling edge of $\overline{\text{CAS}}$ or $\overline{\text{W}}$ strobes data into the on-chip data latch. This latch can be driven from standard TTL circuits without a pull-up resistor. In an early write cycle, $\overline{\text{W}}$ is brought low prior to $\overline{\text{CAS}}$ and the data is strobed in by $\overline{\text{CAS}}$ with setup and hold times referenced to this signal. In a delayed write or read-modify-write cycle, $\overline{\text{CAS}}$ will already be low, thus the data will be strobed in by $\overline{\text{W}}$ with setup and hold times referenced to this signal.

data out (Q)

The three-state output buffer provides direct TTL compatibility (no pull-up resistor required) with a fanout of two Series 54/74 TTL loads. Data out is the same polarity as data in. The output is in the high-impedance (floating) state until $\overline{\text{CAS}}$ is brought low. In a read cycle the output goes active after the access time interval $t_{a(C)}$ that begins with the negative transition of $\overline{\text{CAS}}$ as long as $t_{a(R)}$ is satisfied. The output becomes valid after the access time has elapsed and remains valid while $\overline{\text{CAS}}$ is low; $\overline{\text{CAS}}$ going high returns it to a high-impedance state. In an early write cycle, the output is always in the high-impedance state. In a delayed-write or read-modify-write cycle, the output will follow the sequence for the read cycle.

refresh

A refresh operation must be performed at least every four milliseconds to retain data. Since the output buffer is in the high-impedance state unless $\overline{\text{CAS}}$ is applied, the $\overline{\text{RAS}}$ -only refresh sequence avoids any output during refresh. Strobing each of the 256 row addresses (A0 through A7) with $\overline{\text{RAS}}$ causes all bits in each row to be refreshed. $\overline{\text{CAS}}$ can remain high (inactive) for this refresh sequence to conserve power.

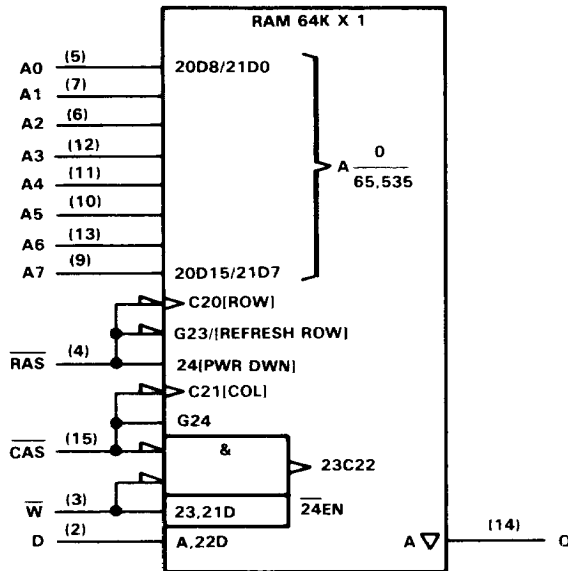

page mode

Page-mode operation allows effectively faster memory access by keeping the same row address and strobing successive column addresses onto the chip. Thus, the time required to set up and strobe sequential row addresses for the same page is eliminated. To extend beyond the 256 column locations on a single RAM, the row address and $\overline{\text{RAS}}$ are applied to multiple 64K RAMs. $\overline{\text{CAS}}$ is then decoded to select the proper RAM.

power up

After power up, the power supply must remain at its steady-state value for 1 ms. In addition, $\overline{\text{RAS}}$ must remain high for 100 μs immediately prior to initialization. Initialization consists of performing eight $\overline{\text{RAS}}$ cycles before proper device operation is achieved.

logic symbol†

†This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12. Pin numbers shown are for the dual-in-line package.

recommended operating conditions

		S VERSION			L VERSION			UNIT
		MIN	NOM	MAX	MIN	NOM	MAX	
V _{DD}	Supply voltage	4.5	5	5.5	4.5	5	5.5	V
V _{SS}	Supply voltage	0			0			V
V _{IH}	High-level input voltage	2.4	V _{CC} +0.3		2.4	V _{CC} +0.3		V
